Assessment overview

- Example Bank Lab cybersecurity risk and ITGC assessment
- Snapshot SNAP-20260926T024908-88653414
- Synthetic local lab · Self-reviewed

Engagement scope

- Local portal application and synthetic PostgreSQL data
- Application identity, access, change, logging, backup and recovery controls
- Canonical assessment records and sanitized portfolio exports
- Assessment period: 2026-08-01 to 2026-08-30

Method

- Frozen-snapshot source reconciliation
- Risk-to-control-to-evidence traceability
- Baseline, action, and retest chain
- Allowlisted sanitized reporting

Control coverage

- 20 of 20 controls have frozen workpapers
- 4 of 20 controls have executed assessment conclusions
- Coverage state: partial
- 16 controls remain unassessed

Findings and remediation

- Findings: 4
- Actions: 4
- Retests: 4
- Verified closures: 4

Evidence and integrity

- Sanitized evidence records: 19
- Workbook contains evidence IDs, not evidence payloads
- Manifest hashes bind every published artifact
- No filesystem paths, queries, backups, or secrets are published

Limitations and next steps

- This is synthetic, local-lab material and is not evidence from a real institution.
- The assessment is self-reviewed and is not an independent audit, certification, or assurance opinion.
- 20 of 20 registered controls have frozen workpapers; 4 have executed assessment conclusions in this snapshot.
- Evidence payloads, filesystem paths, queries, secrets, and backup contents are intentionally excluded.
- PDF artifacts, when present, are local derivatives with a separate render manifest and require visual review before distribution.
- All results are frozen to snapshot SNAP-20260926T024908-88653414 at 2026-09-26T02:49:08.830858Z.
- Next: complete remaining workpapers and obtain independent review if assurance is required.
